

# 5 WAYS TO SAVE ENERGY AT HOME

## 1. Clean or replace filters

Clean or replace your furnace, air conditioner and heat pump filters once a month. Dirty filters can greatly affect the ability of the appliance and waste valuable fuel.

## 2. Heat settings

Set your thermostat at 68F during the winter and at least 5F lower when sleeping or away.

## 3. Clean dryer lint filter

Clean the dryer lint filter after each load. A blocked lint screen requires longer drying time.

## 4. Lower hot water heater temp

Lower your hot water heater temperature to 120F. Bathing and showering consumes a lot of energy.

## 5. Maintain refrigerator temp

Do not cool your food more than you need to. Refrigerators should be set to maintain a 36-40F temperature. Freezers should be set at 0F.
